

On the left side, we have a wireframe for the PC version of our webpage. The Header contains some basic tools like signup/login bar and the webpages name& logo, Navigation has a couple useful links, like homepage and statistics. Under navigation there is on the upper left corner the profile that shows after you sign in. Content includes posts (images, videos, text) from users. Footer includes contacts and something extra yet to be defined, footer is statically at the bottom of the screen.

On the right is the wireframe for the website when viewed on a smartphone. Since the space is limited there, the header has an extra button that opens a popup window for logging in. The navigation bars space is divided with another button that opens your profile information. Content is identical with the PC version. Footer is also at the bottom of the screen and is static.
